

UNets, part 2

Weekend 3, Friday afternoon

Carlos Cotrini

CAS Building ML/AI Applications, ETH Zurich

Friday 2 October 2026

Agenda

Deconvolutional filters

Deconvolutional filters

Deconvolutional filters

Deconvolutional filters

Deconvolutional filters

Convolutional and deconvolutional layers

- A (de)convolutional layer consists of a number of equally-sized (de)convolutional filters, a padding, and a stride.

Convolutional and deconvolutional layers

- A (de)convolutional layer consists of a number of equally-sized (de)convolutional filters, a padding, and a stride.
- The output is a tensor where the number of channels matches the number of filters in the layer.

Convolutional and deconvolutional layers

- A (de)convolutional layer consists of a number of equally-sized (de)convolutional filters, a padding, and a stride.
- The output is a tensor where the number of channels matches the number of filters in the layer.

U-net

- A typical architecture for image segmentation.

U-net

- A typical architecture for image segmentation.
- One can also treat a U-net as some sort of image autoencoder

U-net

Fig. 1. U-net architecture (example for 32x32 pixels in the lowest resolution). Each blue box corresponds to a multi-channel feature map. The number of channels is denoted on top of the box. The x-y-size is provided at the lower left edge of the box. White boxes represent copied feature maps. The arrows denote the different operations.
